UVAFME is written in Fortran(90), and can be run on a Linux platform and easily compiled on a Linux system with the [ifort](#) or [gfortran](#) compiler. Each site simulated in UVAFME is independent from other sites. Thus, when simulating multiple sites, UVAFME runs them in succession. This setup means that UVAFME simulations may be run 'interactively' (i.e. from an active command line session), or distributed across several linux nodes via a job manager such as SLURM.

1 Model Inputs

1.1 Files Needed for UVAFME

In order to successfully run UVAFME, all the necessary files must be present in the correct directories and with the correct naming system. These files/folders must be present (though they need not be named as below):

1. *UVAFME_vx*: the UVAFME executable file for the model, the vx denoting version
2. *file_list.txt*: the text file that tells the model where the input/output directories are located
3. **input_data**: the input directory
4. **output_data**: the output directory

1.1.1 File list file

The file list text file is a Fortran namelist file, which produces format-free inputs of groups of variables, or a selection of a group of variables. This file specifies the path and directories for the input and output folders (Fig. 1). As a namelist file, the parameters **must** match those inside the model. The values on the right side (i.e. those in quotes in Fig. 1) can be changed to match the path/name of the input and output directories. If these files cannot be found, an I/O error will be thrown and the model will not run. If there is a problem with the file list file (e.g. the model cannot find it or read it), default folder names ('input_data' and 'output_data') will be used, and a message will be printed to the screen as such.

```

&filenames
input_directory='input_data'
output_directory='output_data'
climate_directory='input_data'
site_directory='input_data'
sitelist_directory='input_data'
GCM_directory='input_data'
rt_directory='input_data'
speclist_directory='input_data'
/

```

Figure 1: Example of a *file_list.txt* file. As with all Fortran namelist files, the filelist file **must** start with “&filenames” (the name of the namelist in the model) and end with “/”. The parameters for the input/output directories (left side) should **not** be in quotes, whereas the path/name of the folder (right side) should be in quotes.

The directories within the file list should contain the input/output files as follows (see below for description of each file):

- **input_directory**

- *UVAFME2018_rangelist.csv*
- *UVAFME2018_litterpars.csv*

- **output_directory**

- All output files

- **climate_directory**

- *UVAFME2018_climate.csv*
- *UVAFME2018_climate_stddev.csv*
- *UVAFME2018_climate_ex.csv*
- *UVAFME2018_climate_ex_stddev.csv*
- *UVAFME2018_lightning.csv*

- **site_directory**

- *UVAFME2018_site.csv*

- **sitelist_directory**

- *UVAFME2018_sitelist.csv*

- **GCM_directory** (optional)
 - *UVAFME2018_climate_GCM.csv*
- **rt_directory**
 - *UVAFME2018_runtime.txt*
- **speclist_directory**
 - *UVAFME2018_specieslist.csv*

As in Fig. 1, all input files may be in the same input directory, and thus all input directory parameters would be set to the same path/folder. However, these input files need not be in the same directory. The ability to break the input files up into separate directories allows for easier batch runs of multiple sites (see Section 2).

1.1.2 Input files needed

For a basic run, these ten files must be present in the appropriate input directory:

1. *UVAFME2018_runtime.txt*
2. *UVAFME2018_sitelist.csv*
3. *UVAFME2018_site.csv*
4. *UVAFME2018_rangelist.csv*
5. *UVAFME2018_specieslist.csv*
6. *UVAFME2018_climate.csv*
7. *UVAFME2018_climate_stddev.csv*
8. *UVAFME2018_climate_ex.csv*
9. *UVAFME2018_climate_ex_stddev.csv*
10. *UVAFME2018_lightning.csv*
11. *UVAFME2018_litterpars.csv*

An optional *UVAFME2018_climate_GCM.csv* file can be used for a non-linear climate change application (i.e. from a GCM file) (Section 1.3). These files **must** have this exact naming convention or UVAFME will not recognize them and an I/O runtime error will occur.

```

&uvafme
! variables that can be changed
!incr/decr variables are total change, and both should be positive

/

```

Figure 2: Example of a *UVAFME2018_runtime.txt* file. Lines that are commented out with a “!” will not be read and those variables will take on the default parameters. As with all Fortran namelist files, the runtime file **must** start with “&uvafme” and end with “/”.

1.2 Description of Input Files

1.2.1 Runtime File

The *UVAFME2018_runtime.txt* file sets up runtime parameters which are the same across all sites run. Such parameters include how many plots to simulate per site and their size, the number of years to run the simulations, as well as parameters for implementing climate change. The runtime file is a Fortran namelist file (Fig. 2; see above description of filelist file). Thus, the parameter names in the input runtime file **must** match the parameter names set up inside the model or an I/O error will occur, and the default values for all subsequent parameters will be used.

Runtime parameters that can be changed via the runtime file can be seen in Table 1. The climate change-related parameters have checks intended to prevent unintended errors:

1. If using a climate change application (i.e. **with_clim_change** = TRUE) an error is thrown if the duration (i.e. **gcm_duration**) is 0.0.
2. If a linear climate change application is being used, an error is thrown if all of the **incr_** or **decr_tmin/tmax/precip_by** values are 0.0.

3. Errors are thrown if **incr_tmin_by** or **incr_tmax_by** are negative when **incr_or_decr_temp** is 'incr'.
4. Errors are thrown if **decr_tmin_by** or **decr_tmax_by** are 0.0 when **incr_or_decr_temp** is 'decr'.
5. Errors are thrown if **incr_precip_by** is negative when **incr_or_decr_precip** is 'incr'.
6. Errors are thrown if **decr_precip_by** is 0.0 when **incr_or_decr_precip** is 'decr'.
7. The decrease-by values are intended to be input as positive values so if any **decr_tmin/tmax/precip_by** values are negative when a decrease is intended, then the value is changed to positive.

Otherwise, for linear climate change applications, the annual temperature and precipitation change is calculated as:

$$t' = \begin{cases} \frac{incr_t_by}{gcm_duration+1}, & incr_or_decr_temp = 'incr' \\ \frac{-decr_t_by}{gcm_duration+1}, & incr_or_decr_temp = 'decr' \end{cases} \quad (1)$$

and

$$p' = \begin{cases} \frac{incr_precip_by}{gcm_duration+1}, & incr_or_decr_prcp = 'incr' \\ \frac{-decr_precip_by}{gcm_duration+1}, & incr_or_decr_prcp = 'decr' \end{cases} \quad (2)$$

where t' is the annual minimum or maximum temperature change ($^{\circ}\text{C}$), p' is the annual precipitation change (proportional), and $incr_t_by$ and $decr_t_by$ are the overall linear **incr_tmin/tmax_by** or **decr_tmin/tmax_by** values.

1.2.2 Sitelist File

The *UVAFME2018_sitelist.csv* file sets up the sites to be run in a simulation, as well as site-specific parameters such as the elevation of a site. While each of these parameters is generally also present in the site file (*UVAFME2018_site.csv*) or is a default parameter in the model, the setup here allows for sites to be parameterized with “base” conditions in the Site file, and run with different parameters using the Sitelist file. This setup also allows the same site to be run multiple times with different parameters values (e.g. the same site run a multiple elevations). The Sitelist file must have the site IDs of each site to be run present in the **siteID** column, but all other columns may be left blank. Any other parameter left blank in the Sitelist file will take the values present in the Site file or default values in the model.

Table 1: Parameters set up in runtime file.

| Parameter Name | Description | Default Value |
|----------------------------|---|--------------------|
| numplots | number of plots to run per site | 200 |
| plotsize | size of plot | 500 m ² |
| year_print_interval | interval at which to print output data | 10 years |
| maxcells | maximum possible rows/columns for plot grid, maxcells*maxcells = maximum plants on plot | 100 |
| maxtrees | maximum trees on plot | 1000 |
| maxshrubs | maximum shrubs on plot | 9000 |
| fixed_seed | whether random seed is default (.true.) or generated (.false.) | .false. |
| debug | debug flag related to random number generators | .false. |
| incr_tmin_by | amount to increase \bar{t}_{min} under linear climate change application | 0.0 °C |
| incr_tmax_by | amount to increase \bar{t}_{max} under linear climate change application | 0.0 °C |
| incr_precip_by | proportion to increase \bar{p} under linear climate change application | 0.0 |
| decr_tmin_by | amount to decrease \bar{t}_{min} under linear climate change application | 0.0 °C |
| decr_tmax_by | amount to decrease \bar{t}_{max} under linear climate change application | 0.0 °C |
| decr_precip_by | proportion to decrease \bar{p} under linear climate change application | 0.0 |
| incr_or_decr_prdp | whether or increase or decrease \bar{p} under linear climate change application | 'decr' |
| incr_or_decr_temp | whether or increase or decrease \bar{t} under linear climate change application | 'incr' |
| with_clim_change | whether or not to run with climate change application | .false. |
| use_gcm | whether or not to use an input GCM file for climate change application | .false. |
| linear_cc | whether or not to use a linear climate change application | .false. |
| gcm_duration | the length of the climate change application | 0 years |
| start_gcm | the start year of the input GCM file | 0 |
| end_gcm | the end year of the input GCM file | 100 |
| fire_on | whether to simulate fire | .false. |
| fire_tesing | whether to force a fire at a specific time | .false. |
| use_rangelist | whether to use input rangelist | .true. |
| use_climstd | whether to use input climate standard deviation file | .true. |
| tree_level_data | whether to print out tree-level output data | .false. |
| plot_level_data | whether to print out plot-level output data | .false. |
| testing | whether to print out fine-scale fire and soil output | .false. |
| conds_testing | whether to print out fine-scale fuel condition output data | .false. |
| reg_testing | whether to print out fine-scale regeneration output data | .false. |

Table 2: Sitelist file parameters.

| Column Number | Column Name | Description | Units |
|---------------|------------------|--|-------------------|
| 1 | siteID | site ID for site - must include for runs | integer |
| 2 | runID | run ID for site | integer |
| 3 | altitude | altitude for site | meters |
| 4 | fire_year | stand age to force a fire | years |
| 5 | fire_day | day of year force a fire | Julian day |
| 6 | fire_wind | wind speed to force on day of fire | m s ⁻¹ |
| 7 | fire_ffmc | FFMC to force on day of fire | - |
| 8 | fire_dmc | DMC to force on day of fire | - |

Table 3: Specieslist file parameters.

| Column Number | Column Name | Description | Units | Data Source |
|---------------|------------------------|---|--|--|
| 1 | Group | genus group number | integer | |
| 2 | Genus | genus of tree | character | |
| 3 | Individual | individual species number | integer | |
| 4 | Scientific Name | latin name of species | character | |
| 5 | English Name | common name of species | character | |
| 6 | form | form of species (1 - tree; 2 - tree-like shrub; 3 - shrub; 4 - prostrate shrub) | integer | |
| 7 | AGE_{max} | average maximum age | years | |
| 8 | DBH_{max} | average maximum DBH | cm | |
| 9 | H_{max} | average maximum height | m | |
| 10 | $rootdepth$ | average rooting depth | m | |
| 11 | s | initial height-diameter relationship | $m\ cm^{-1}$ | Equation A4 from Botkin, Janak, and Wallis (1972) (Fig. 3 below) |
| 12 | g | growth parameter | | Equation A4 from Botkin et al. (1972) (Eq. 3 below) |
| 13 | β | stem shape parameter | | default 1.32 for coniferous; 1.52 for broadleaf |
| 14 | bulk | bulk density of wood | tonnes m^{-3} | Miles and Smith 2008 |
| 15 | D_L | Scalar parameter for $L:A\ D_{L:0.5}$ relationship | | default 0.184 for coniferous; § 0.175 for broadleaf |
| 16 | LMA | leaf mass per area | tonnes $C\ ha^{-1}$ | default 0.2 for coniferous; 0.095 for broadleaf |
| 17 | GDD_{min} | minimum degree day threshold (5°C base) | degree-days | |
| 18 | GDD_{opt} | optimum degree day threshold (5°C base) | degree-days | |
| 19 | GDD_{max} | maximum degree day threshold (5°C base) | degree-days | |
| 20 | shade | relative shade tolerance | 1-5; 5 = least tolerant | |
| 21 | drought | relative drought tolerance | 1-6; 6 = least tolerant | |
| 22 | flood | relative inundation tolerance | 1-6; 6 = least tolerant | |
| 23 | pernif | relative permafrost tolerance | 1-2; 2 = least tolerant | |
| 24 | nutrient | relative low nutrient tolerance | 1-3; 3 = least tolerant | |
| 25 | bark_thick | bark thickness per cm DBH | cm bark cm DBH^{-1} | Keane, Loehman, and Holsinger (2011) |
| 26 | F_i | scorch height parameter | default 0.11 for needleleaf; 0.094 for broadleaf species | |
| 27 | fire_regen | relative ability of plant to resprout, regrow, or produce seed after fire | 1-6; 1 = high reproduction after fire; 6 = low reproduction after fire | |
| 28 | stress_tol | relative ability to withstand low growth from stress | 1-5; 5 = least tolerant | |
| 29 | death_tol | relative ability to live to AGE_{max} | 1-3; 3 = least likely | |
| 30 | dbh_min | minimum diameter increment growth before "stressed" | cm | |
| 31 | evergreen | evergreen or deciduous | evergreen = 1; deciduous = 0 | |
| 32 | litter_class | integer for litter class | | |
| 33 | invader | seed numbers from outside the plot | seeds m^{-2} | wind dispersed seeds = 1 |
| 34 | seed | seed numbers from within plot | seeds m^{-2} | e.g. cones ≈ 1; samaras ≈ 10; wind dispersed ≈ 100 |
| 35 | sprout | average sprouts produced per individual | | |
| 36 | layering | ability of species to reproduce by layering | 0 or 1 | |
| 37 | org_tol | relative ability of species to reproduce on deep organic layers | 1-3; 3 = least tolerant | |
| 38 | recr_age | age at which species can reproduce | years | |
| 39 | min_recr_dbh | diameter at which species can reproduce | cm | |
| 40 | seed_surv | proportion seedbank lost annually | 0 to 1 | |
| 41 | seedling_surv | proportion seedling bank lost annually | 0 to 1 | |
| 42 | species_id | unique eight character code consisting of first four letters of genus and first four letters of species | | |

§: D_L is further modified based on the species-specific shade tolerance (**shade**, tol_{shade}): $D_L = adj \times tol_{shade}$, where adj ranges from 1.5 to 1.7 depending on shade tolerance.

1.2.3 Specieslist File

The *UVAFME2018_specieslist.csv* file contains the species-level parameters for each species to be simulated. These parameters include average maximum age, DBH, and height, tolerance levels to shade, drought and nutrients, and seedling/seedbank parameters (Table 3). Unless otherwise noted, most parameters are derived from a scientific literature review (e.g. Burns and Honkala (1990)).

To derive the parameters s and g , equation A4 from Botkin et al. (1972) is used. For trees, the parameter g is calculated using input parameters of H_{max} , DBH_{max} , and AGE_{max} :

$$g = \frac{4H_{max}}{AGE_{max}} \left[\ln \left(2(2DBH_{max} - 1) \right) + \frac{\alpha}{2 \ln(e_1)} - f \ln \left(\frac{a \times c}{b \times d} \right) \right] \quad (3)$$

where:

$$\alpha = 1 - 1.37/H_{max} \quad (4)$$

$$e_1 = \frac{\frac{9}{4} + 0.5\alpha}{(4DBH_{max}^2 + 2\alpha DBH_{max} - \alpha)} \quad (5)$$

$$a = 3 + \alpha - \sqrt{\alpha^2 + 4\alpha} \quad (6)$$

$$b = 3 + \alpha + \sqrt{\alpha^2 + 4\alpha} \quad (7)$$

$$c = 4DBH_{max} + \alpha + \sqrt{\alpha^2 + 4\alpha} \quad (8)$$

$$d = 4DBH_{max} + \alpha - \sqrt{\alpha^2 + 4\alpha} \quad (9)$$

and

$$f = \frac{\alpha + 0.5\alpha^2}{\sqrt{\alpha^2 + 4\alpha}} \quad (10)$$

For shrubs, g is derived as:

$$g = \frac{4H_{max}}{AGE_{max}} \left[\ln \left(2(2D_{max} - 1) \right) + \frac{1}{2 \ln(e_1)} - f \ln \left(\frac{a \times c}{b \times d} \right) \right] \quad (11)$$

where D is the basal diameter (cm), $a = 1.763932$, $b = 6.236068$, $c = 4D_{max} + 3.236068$, $d = 4D_{max} - 1.236068$, $f = 0.6708204$, and $e_1 = \frac{2.75}{(4D_{max}^2 + 2D_{max} - 1)}$.

The parameter g is further modified within the model depending on shade tolerance, such that $g = g \times l$, where l ranges from 1.1 to 1.25 depending on shade tolerance. The parameter s is derived by regressing the initial height-diameter relationship calculated using Mitscherlich's equation (Botkin et al. (1972); Eq. 12) with different s values and that using a polynomial equation (Eq. 13) until the slope of a line with y-intercept 0 is closest to 1.0 and the R^2 is closest to 1.0 (Fig. 3).

For trees:

$$H_m = 1.3 + (H_{max} - 1.3)(1 - e^{\frac{-sDBH}{H_{max}-1.3}}) \quad (12)$$

$$H_p = (137 + b_2DBH - b_3DBH^2)/100 \quad (13)$$

where $b_2 = 2 \frac{H_{maxcm}-137}{DBH_{max}}$ and $b_3 = \frac{H_{maxcm}-137}{DBH_{max}^2}$.

For shrubs:

$$H_m = (H_{max})(1 - e^{\frac{-sD}{H_{max}}}) \quad (14)$$

$$H_p = (b_2D - b_3D^2)/100 \quad (15)$$

where $b_2 = 2 \frac{H_{maxcm}}{D_{max}}$ and $b_3 = \frac{H_{maxcm}}{D_{max}^2}$.

Figure 3: Example derivation of parameter s for a tree species with $H_{max} = 30$ m, $DBH_{max} = 76$ cm, and $AGE_{max} = 170$ years.

1.2.4 Site File

The *UVAFME2018_site.csv* file contains site-specific parameters for each site, including latitude, longitude, topography, soil characteristics, disturbance probabilities, and values for modifying temperature and precipitation if the elevation of the site is changed (i.e. climatic lapse rates) (Table 4). As with all other site-related files, the **siteID** column must match the site ids in all other files.

Table 4: Site file parameters.

| Column Number | Column Name | Description | Units | Data Source |
|---------------|------------------|--|--|-------------------------------|
| 1 | site | unique site ID | integer | user generated |
| 2 | latitude | latitude of site | decimal degrees | |
| 3 | longitude | longitude of site | decimal degrees | |
| 4 | name | site name | character | |
| 5 | region | region of site | character | |
| 6 | elevation | elevation of site | meters | DEM |
| 7 | slope | slope of site | degrees | DEM |
| 8 | aspect | aspect of site | degrees | DEM |
| 9 | a_sat | saturation capacity of mineral layer | volumetric | site description; soil maps |
| 10 | a_fc | field capacity of mineral layer | volumetric | site description; soil maps |
| 11 | a_pwp | permanent wilting point of mineral layer | volumetric | site description; soil maps |
| 12 | o_sat | saturation capacity of organic layer | volumetric | site description; soil maps |
| 13 | o_fc | field capacity of organic layer | volumetric | site description; soil maps |
| 14 | o_pwp | permanent wilting point of organic layer | volumetric | site description; soil maps |
| 15 | a_bd | bulk density of mineral layer | kg m ⁻³ | site description; soil maps |
| 16 | o_bd | bulk density of organic layer | kg m ⁻³ | site description; soil maps |
| 17 | itxt | soil texture | 0: very coarse 1: coarse 2: fine | site description; soil maps |
| 16 | hum_int | initial humus amount | t ha ⁻¹ | site description; soil maps |
| 17 | A_depth | depth of mineral (A) layer | m | site description; soil maps |
| 18 | wind_prob | windthrow events in 1000 years | 1000/WRI | literature; site descriptions |
| 19 | stand_age | simulation year to stop simulation | years | literature; site descriptions |
| 20 | gcm_year | simulation year to start climate change | years | |
| 21 | flow | water input from overland flow | mm | |

1.2.5 Rangelist File

The *UVAFME2018_rangelist.csv* file determines which species are eligible for colonization and growth at each site (Table 5). The column names are the species ids (8-character IDs set up in the *UVAFME2018_specieslist.csv* file), and the rows are each site. If a species is present at a site then the column/row will have a 1, and if the species is absent the column/row will have a 0. This is the only csv file where the column names are explicitly read by UVAFME and must match the species ids as set up in the Specieslist file. The order must also match the order of the Specieslist file. The presence/absence of each species is generally derived from species range maps (e.g. Little 1971) or site descriptions.

Table 5: Rangelist file parameters.

| Column Number | Column Name | Description | Units |
|----------------------------|-------------------|--|--------------------------|
| 1 | site | unique site ID | integer |
| 2 | latitude | latitude of site | decimal degrees |
| 3 | longitude | longitude of site | decimal degrees |
| 4 ... n _{species} | unique species ID | presence or absence of species at site | 0: absent; 1: present |

1.2.6 Climate Files

The *UVAFME2018_climate.csv*, *UVAFME2018_climate_stddev.csv*, *UVAFME2018_climate_ex.csv*, *UVAFME2018_climate_ex_stddev.csv*, and *UVAFME2018_lightning.csv* files contain the average and standard deviations of monthly minimum and maximum temperatures, precipitation, cloud cover, relative humidity, wind speed, and lightning strike density for each site (Tables 6 - 10). These data are generally derived from at least 30 years of historical climate data and are used to generate monthly and daily weather conditions within UVAFME.

Table 6: *UVAFME2018_climate.csv* file parameters.

| Column Number | Column Name | Description | Units |
|---------------|---------------------|----------------------------------|-----------------|
| 1 | site | unique site ID | integer |
| 2 | latitude | latitude of site | decimal degrees |
| 3 | longitude | longitude of site | decimal degrees |
| 4 - 15 | tmin_[month] | mean monthly minimum temperature | °C |
| 16 - 27 | tmax_[month] | mean monthly maximum temperature | °C |
| 28 - 39 | prcp_[month] | monthly precipitation | mm |

Table 7: *UVAFME2018_climate_stddev.csv* file parameters.

| Column Number | Column Name | Description | Units |
|---------------|-------------------------|---|-----------------|
| 1 | site | unique site ID | integer |
| 2 | latitude | latitude of site | decimal degrees |
| 3 | longitude | longitude of site | decimal degrees |
| 4 - 15 | tmin_std_[month] | standard deviation of monthly minimum temperature | °C |
| 16 - 27 | tmax_std_[month] | standard deviation of monthly maximum temperature | °C |
| 28 - 39 | prcp_std_[month] | standard deviation of monthly precipitation | mm |

Table 8: *UVAFME2018_ex_climate.csv* file parameters.

| Column Number | Column Name | Description | Units |
|---------------|--------------|--------------------------------|-------------------|
| 1 | site | unique site ID | integer |
| 2 | latitude | latitude of site | decimal degrees |
| 3 | longitude | longitude of site | decimal degrees |
| 4 - 15 | cld_[month] | mean monthly cloudiness | % sky covered |
| 16 - 27 | rh_[month] | mean monthly relative humidity | % |
| 28 - 39 | wind_[month] | mean monthly wind speed | m s ⁻¹ |

| Column Number | Column Name | Description | Units |
|---------------|-----------------|---|-----------------|
| 1 | site | unique site ID | integer |
| 2 | latitude | latitude of site | decimal degrees |
| 3 | longitude | longitude of site | decimal degrees |
| 4 - 15 | cld_std_[month] | standard deviation of monthly cloudiness | % sky covered |
| 16 - 27 | rh_std_[month] | standard deviation of monthly relative humidity | % |

Table 10: *UVAFME2018_lightning.csv* file parameters.

| Column Number | Column Name | Description | Units |
|---------------|-------------------|--|--|
| 1 | site | unique site ID | integer |
| 2 | latitude | latitude of site | decimal degrees |
| 3 | longitude | longitude of site | decimal degrees |
| 4 - 15 | strmn_[month] | mean monthly lightning strike density | strikes km ⁻² day ⁻¹ |
| 16 - 27 | strmn_std_[month] | standard deviation of monthly lightning strike density | strikes km ⁻² day ⁻¹ |

1.2.7 Litter Parameters File

The *UVAFME2018_litterpars.csv* file contains the litter parameters used in the decomposition routine.

Table 11: *UVAFME2018_litterpars.csv* file parameters. Parameter values are taken from [Bonan \(1990\)](#), [Pastor and Post \(1985\)](#), and other available sources.

| Column Number | Column Name | Description | Units |
|---------------|-----------------------|--|-------------------------------------|
| 1 | name | cohort name | character |
| 2 | InitialN | initial N percent | 0 to 1 |
| 3 | gImmob_gwtloss | g N immobilized per g weight loss | g g^{-1} |
| 4 | critN | percent N at which a decaying litter cohort is transferred to well-decayed wood or humus | 0 to 1 |
| 5 | litter_type | litter type ID | integer |
| 6 | destination | if cohort is transferred to well-decayed wood or humus | 1 = humus; 2 = well-decayed wood |
| 7 | initialLignin | initial percent lignin of cohort | 0 to 1 |
| 8 | ligParA | lignin parameter <i>A</i> | |
| 9 | ligParB | lignin parameter <i>B</i> | |
| 10 | Ash | ash correction factor | 0 to 1 |
| 11 | BD_fresh | bulk density of fresh litter | kg m^{-3} |
| 12 | SAV_fresh | surface area to volume ratio of fresh litter | cm^{-1} |

1.3 Optional Input Files

1.3.1 Climate GCM File

UVAFME has the option of applying climate change in the form of changing monthly minimum and maximum temperatures, precipitation, and lightning. The input files required for this application are the *UVAFME2018_climate_GCM.csv* and *UVAFME2018_lightning_GCM.csv* files. Each contains the site ID, year, and monthly climate variables for each year of the climate change application (Tables 12 and 13). Data for this file can be taken from output from earth system models or created by the user.

Table 12: *UVAFME2018_climate_GCM.csv* file parameters.

| Column Number | Column Name | Description | Units |
|---------------|-------------------|------------------------------------|---|
| 1 | site | unique site ID | integer |
| 2 | latitude | latitude of site | decimal degrees |
| 3 | longitude | longitude of site | decimal degrees |
| 4 | year | year of climate change application | integer |
| 5-16 | tmin_month | mean monthly minimum temperature | $^{\circ}\text{C}$ |
| 17-28 | tmax_month | mean monthly maximum temperature | $^{\circ}\text{C}$ |
| 29-40 | prcp_month | mean monthly precipitation | $\text{strikes km}^{-2} \text{ day}^{-1}$ |

Table 13: *UVAFME2018_lightning_GCM.csv* file parameters.

| Column Number | Column Name | Description | Units |
|---------------|--------------------|---------------------------------------|-----------------|
| 1 | site | unique site ID | integer |
| 2 | latitude | latitude of site | decimal degrees |
| 3 | longitude | longitude of site | decimal degrees |
| 4 | year | year of climate change application | integer |
| 5-16 | strmn_month | mean monthly lightning strike density | °C |

2 Running the Model

To run UVAFME interactively from the command line simply enter:

```
./UVAFME_vx file_list.txt
```

This will run the model at each site specified in the Sitelist file, in order. Once the model has finished running, the output files will be in the **output_data** directory. These output files will be rewritten every time the model is run, so be sure to save them elsewhere or with a different name (if desired) before re-running.

As mentioned above, the independence of the UVAFME sites allows for batches of sites to be distributed across several nodes of a computing cluster. This can be done iteratively, using different *file_list.txt* files which point the model to different input/output directories. It can also be accomplished using a job manager such as [SLURM](#).

3 Model Outputs

3.1 Standard Outputs

3.1.1 Species and Genus Output

UVAFME outputs two standard files related to species- and genus-level forest characteristics, the *Species_Data.csv* file and the *Genus_Data.csv* file. For both files, at the specified year print interval (Section 1), the average (i.e. across plot) conditions for each species or genus are printed. If a species is specified as absent at a site in the input Rangelist file, the row is still printed but –999's (i.e. the NA signifier) are printed in the data columns.

UVAFME also outputs species- and genus-level files on the characteristics of trees that died each year, the *Dead_Species_Data.csv* file and the *Dead_Genus_Data.csv* file. For both files, at the specified year print interval (Section 1), the average (i.e. across plot) conditions for trees that died from each species or genus are

printed. If a species is specified as absent at a site in the input Rangelist file, the row is still printed but –999's are printed in the data columns.

Table 14: *Species.Data.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|-------------------|--|---------------------------------|
| 1 | siteID | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | genus | the genus of the species | character |
| 5 | species | the species ID | character |
| 6-16 | [xx] to [xx] | stem density in DBH bins | trees ha ⁻¹ |
| 17-27 | [xx] to [xx] biom | biomass in DBH bins | tC ha ⁻¹ |
| 28 | degday_resp | growth response to temperature | 0 to 1 |
| 29 | drought_resp | growth response to drought | 0 to 1 |
| 30 | shade_resp | growth response to shade | 0 to 1 |
| 31 | perm_resp | growth response to permafrost | 0 to 1 |
| 32 | flood_resp | growth response to inundation | 0 to 1 |
| 33 | nutrient_resp | growth response to nutrients | 0 to 1 |
| 34 | max_diam | maximum DBH | cm |
| 35 | mean_diam | average DBH | cm |
| 36 | mean_age | average tree age | years |
| 37 | max_hgt | maximum height | m |
| 38 | leaf_area_ind | leaf area index | m ² m ⁻² |
| 39 | basal_area | basal area | m ² ha ⁻¹ |
| 40 | basal_sd | standard deviation of basal area | m ² ha ⁻¹ |
| 41 | total_biomC | aboveground biomass | tC ha ⁻¹ |
| 42 | biomC_sd | standard deviation of aboveground biomass | tC ha ⁻¹ |
| 43 | biomC_lg | aboveground biomass of trees ≥ 9cm DBH | tC ha ⁻¹ |
| 44 | biomC_std_lg | standard deviation of aboveground biomass of trees ≥ 9cm DBH | tC ha ⁻¹ |
| 45 | biomC_sm | aboveground biomass of trees < 9cm DBH | tC ha ⁻¹ |
| 46 | biomC_std_sm | standard deviation of aboveground biomass of trees < 9cm DBH | tC ha ⁻¹ |
| 47 | basal_lg | basal area of trees ≥ 9cm DBH | m ² ha ⁻¹ |
| 48 | basal_std_lg | standard deviation of basal area of trees ≥ 9cm DBH | m ² ha ⁻¹ |
| 49 | basal_sm | basal area of trees < 9cm DBH | m ² ha ⁻¹ |
| 50 | basal_std_sm | standard deviation of basal area of trees < 9cm DBH | m ² ha ⁻¹ |
| 51 | dens_lg | stem density of trees ≥ 9cm DBH | trees ha ⁻¹ |
| 52 | dens_std_lg | standard deviation of stem density of trees ≥ 9cm DBH | trees ha ⁻¹ |
| 53 | dens_sm | stem density of trees < 9cm DBH | trees ha ⁻¹ |
| 54 | dens_std_sm | standard deviation of stem density of trees < 9cm DBH | trees ha ⁻¹ |
| 55 | dbh_lg | average diameter of trees ≥ 9cm DBH | cm |
| 56 | dbh_std_lg | standard deviation of average diameter of trees ≥ 9cm DBH | cm |
| 57 | dbh_sm | average diameter of trees < 9cm DBH | cm |
| 58 | dbh_std_sm | standard deviation of average diameter of trees < 9cm DBH | cm |

Table 15: *Genus_Data.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|-------------------|--|---------------------------------|
| 1 | siteID | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | genus | the genus of the species | character |
| 5-15 | [xx] to [xx] | stem density in DBH bins | trees ha ⁻¹ |

| 15 | biomC_sd | standard deviation of biomass | tC ha ⁻¹ |

3.1.2 Across-Species/Genus Output

UVAFME outputs a file related to across-species/genus forest characteristics, the *Total_Plot_Values.csv* file. For this file, at the specified year print interval (Section 1), the average (i.e. across plot) conditions for all genera are printed.

Table 18: *Total_Plot_Values.csv* file variables.

| Column Number | Column Name | Description | Units |
|---------------|------------------|---|---------------------------------|
| 1 | siteID | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | gdd_death | biomass loss due to low temperature stress | tC ha ⁻¹ |
| 5 | drought_death | biomass loss due to drought stress | tC ha ⁻¹ |
| 6 | shade_death | biomass loss due to shade stress | tC ha ⁻¹ |

| 9 | nutrient_death | biomass loss due to low nutrient stress | tC ha ⁻¹ |
| 10 | fire_death | biomass loss due to fire | tC ha ⁻¹ |
| 11 | wind_death | biomass loss due to windthrow | tC ha ⁻¹ |
| 12 | gddresp_1 | growth response to temperature for trees 0-10 cm in DBH | 0 to 1 |
| 13 | gddresp_2 | growth response to temperature for trees 10-20 cm in DBH | 0 to 1 |
| 14 | gddresp_3 | growth response to temperature for trees 20-40 cm in DBH | 0 to 1 |
| 15 | gddresp_4 | growth response to temperature for trees 40+ cm in DBH | 0 to 1 |
| 16 | droughtresp_1 | growth response to drought for trees 0-10 cm in DBH | 0 to 1 |
| 17 | droughtresp_2 | growth response to drought for trees 0-20 cm in DBH | 0 to 1 |
| 18 | droughtresp_3 | growth response to drought for trees 20-40 cm in DBH | 0 to 1 |
| 19 | droughtresp_4 | growth response to drought for trees 40+ cm in DBH | 0 to 1 |
| 20 | shaderesp_1 | growth response to shade for trees 0-10 cm in DBH | 0 to 1 |
| 21 | shaderesp_2 | growth response to shade for trees 10-20 cm in DBH | 0 to 1 |
| 22 | shaderesp_3 | growth response to shade for trees 20-40 cm in DBH | 0 to 1 |
| 23 | shaderesp_4 | growth response to shade for trees 40+ cm in DBH | 0 to 1 |
| 24 | permresp_1 | growth response to permafrost for trees 0-10 cm in DBH | 0 to 1 |
| 25 | permresp_2 | growth response to permafrost for trees 0-20 cm in DBH | 0 to 1 |
| 26 | permresp_3 | growth response to permafrost for trees 20-40 cm in DBH | 0 to 1 |
| 27 | permresp_4 | growth response to permafrost for trees 40+ cm in DBH | 0 to 1 |
| 28 | floodresp_1 | growth response to inundation for trees 0-10 cm in DBH | 0 to 1 |
| 29 | floodresp_2 | growth response to inundation for trees 10-20 cm in DBH | 0 to 1 |
| 30 | floodresp_3 | growth response to inundation for trees 20-40 cm in DBH | 0 to 1 |
| 31 | floodresp_4 | growth response to inundation for trees 40+ cm in DBH | 0 to 1 |
| 32 | nutrientresp_1 | growth response to nutrients for trees 0-10 cm in DBH | 0 to 1 |
| 33 | nutrientresp_2 | growth response to nutrients for trees 0-20 cm in DBH | 0 to 1 |
| 34 | nutrientresp_3 | growth response to nutrients for trees 20-40 cm in DBH | 0 to 1 |
| 35 | nutrientresp_3 | growth response to nutrients for trees 40+ cm in DBH | 0 to 1 |
| 36 | Loreys_height | average Loreys height | m |
| 37 | Loreys_height_sd | standard deviation of Loreys height | m |
| 38 | max_height | average maximum height | m |
| 39 | max_height_sd | standard deviation of maximum height | m |
| 40 | total_biomC | average aboveground biomass | tC ha ⁻¹ |
| 41 | total_biomC_sd | standard deviation of biomass | tC ha ⁻¹ |
| 42 | basal_area | average basal area | m ² ha ⁻¹ |
| 43 | basal_area_sd | standard deviation of basal area | m ² ha ⁻¹ |
| 44 | total_stems | average stem density | trees ha ⁻¹ |
| 45 | total_stems_sd | standard deviation of stem density | trees ha ⁻¹ |
| 46 | small_stems | average stem density for trees ≤ 5 cm DBH | trees ha ⁻¹ |
| 47 | small_stems_sd | standard deviation of stem density for trees ≤ 5 cm DBH | trees ha ⁻¹ |
| 48 | med_stems | average stem density for trees > 5 cm and ≤ 20 cm DBH | trees ha ⁻¹ |
| 49 | med_stems_sd | standard deviation of stem density for trees > 5 cm and ≤ 20 cm DBH | trees ha ⁻¹ |
| 50 | lg_stems | average stem density for trees > 20 cm DBH | trees ha ⁻¹ |
| 51 | lg_stems_sd | standard deviation of stem density for trees > 20 cm DBH | trees ha ⁻¹ |
| 52 | stand_age | average stand age | years |
| 53 | stand_age_sd | standard deviation of stand age | years |
| 54-65 | LAI_[1-12] | LAI in 5-m canopy sections (0-5...55-60) | m ² m ⁻² |

3.1.3 Site and Climate Output

UVAFME outputs a file related to climate and site characteristics, the *Climate.csv* file. For this file, at the specified year print interval (Section 1), the several climate variables are printed out. Note output variables **thaw_depth**, **organic_depth**, **avail_n**, **dryd_upper** and **dryd_lower** are averaged across all plots, all others are equal across all plots.

Table 19: *Climate.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|---------------|--|----------------------|
| 1 | siteID | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | rain | annual precipitation (snow and liquid) | cm |
| 5 | pet | annual potential evapotranspiration | cm |
| 6 | solar_rad | annual surface solar radiation | cal cm ² |
| 7 | thaw_depth | active layer depth | cm |
| 8 | organic_depth | organic layer depth | cm |
| 9 | avail_n | plant-available N | kgN ha ⁻¹ |
| 10 | aet | actual evapotranspiration | cm |
| 11 | grow | growing season length | days |
| 12 | pc_germ | effect of temperature on black spruce regeneration | 0-1 |
| 13 | degd | growing degree-days | °C-days |
| 14 | drydays | drought index | 0-1 |
| 15 | saw0_ByFC | average mineral layer moisture scaled by field capacity | |
| 16 | saw0_BySAT | average mineral layer moisture scaled by saturation capacity | |
| 17 | aow0_ByMin | average organic layer moisture scaled by wilting point | |
| 18 | wilt_days | proportion of growing season below wilting point | 0-1 |
| 19 | flood_d | proportion of growing season with flooded conditions | 0-1 |

3.1.4 Soil Output

UVAFME outputs a file related to soil characteristics, the *SoilDecomp.csv* file. For this file, at the specified year print interval (Section 1), the several soil-related variables are printed out, averaged across all plots.

Table 20: *SoilDecomp.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|--------------|--|----------------------|
| 1 | siteID | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | odepth | average organic layer depth | cm |
| 5 | odepth_sd | standard deviation of organic layer depth | cm |
| 6 | mdepth | live moss depth | cm |
| 7 | moss_biom | live moss biomass | kg ha ⁻¹ |
| 8 | active | active layer depth | cm |
| 9 | OM | humus organic matter weight | t ha ⁻¹ |
| 10 | OM_N | organic matter N | tN ha ⁻¹ |
| 11 | lit_cornus | <i>Cornus</i> leaf litter weight | t ha ⁻¹ |
| 12 | lit_acerfrax | <i>Acer</i> and <i>Fraxinus</i> leaf litter weight | t ha ⁻¹ |
| 13 | lit_prunus | <i>Prunus</i> leaf litter weight | t ha ⁻¹ |
| 14 | lit_betula | <i>Betula</i> leaf litter weight | t ha ⁻¹ |
| 15 | lit_queralba | <i>Quercus alba</i> leaf litter weight | t ha ⁻¹ |
| 16 | lit_tsugthuj | <i>Tsuga</i> and <i>Thuja</i> leaf litter weight | t ha ⁻¹ |
| 17 | lit_populus | <i>Populus</i> leaf litter weight | t ha ⁻¹ |
| 18 | lit_fagus | <i>Fagus</i> leaf litter weight | t ha ⁻¹ |
| 19 | lit_querrubr | <i>Quercus rubra</i> leaf litter weight | t ha ⁻¹ |
| 20 | lit_abies | <i>Abies</i> leaf litter weight | t ha ⁻¹ |
| 21 | lit_picea | <i>Picea</i> leaf litter weight | t ha ⁻¹ |
| 22 | lit_pinus | <i>Pinus</i> leaf litter weight | t ha ⁻¹ |
| 23 | lit_roots | root litter cohort weight | t ha ⁻¹ |
| 24 | lit_smboles | small bole (< 10 cm DBH) litter cohort weight | t ha ⁻¹ |
| 25 | lit_lboles | large bole (> 10 cm DBH) litter cohort weight | t ha ⁻¹ |
| 26 | lit_twigs | twig litter cohort weight | t ha ⁻¹ |
| 27 | lit_smbranch | small branch litter cohort weight | t ha ⁻¹ |
| 28 | lit_lbranch | large branch litter cohort weight | t ha ⁻¹ |
| 29 | lit_WDW | well-decayed wood litter cohort weight | t ha ⁻¹ |
| 30 | lit_moss | moss litter cohort weight | t ha ⁻¹ |
| 31 | avail_n | plant-available N | kgN ha ⁻¹ |

3.1.5 Other Output Files

UVAFME also outputs two text files, *log.txt* and *site.log.txt*, that print messages regarding site and species data that are read in and initialized (for *log.txt*) and whether each site run was successfully completed (for *site.log.txt*).

For the *log.txt* file, UVAFME will write “Site data initialized. Total read in: [X]”, where X is the number of sites read in from the site input file. It will also write “Species data initialized. Total read in: [X]”, where X is the number of species read in from the species parameter input file. Following this, it will write “Species data initialized for site [X], where X is the site ID of each site run, each time the species data is initialized for that site.

This file may also contain other messages if no climate data is found for a

specific site: (e.g. “No climate data for site number [X]”). If any issues come up during runtime, the *log.txt* file is a good first place to check. UVAFME also prints some error messages directly to the screen, especially if these errors cause the program to exit.

For the *site.log.txt* file, UVAFME will print “Finished site [X]” (where X is the site ID) for each site it finished simulating. This file can be used to check to make sure all sites completed in a larger run.

3.2 Optional Outputs

3.2.1 Plot-level Output

UVAFME can optionally (see Section 1) output files which print plot-level species- and genus-level forest characteristics, the *Plot_Species_Data.csv* and *Plot_Genus_Data.csv* files. For these files, at the specified year print interval (Section 1), the plot conditions for trees from each species or genus are printed. If a species is specified as absent at a site in the input Rangelist file, the row is still printed but –999’s are printed in the data columns. Note: this will result in a lot of output data and will slow down your runs considerably, thus the *plot_level_data* flag in the runtime file should be used sparingly and only if necessary.

Table 21: *Plot_Species_Data.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|--------------------------|--------------------------|---------------------------------|
| 1 | siteID | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | plot | plot number | integer |
| 5 | genus | the genus of the species | character |
| 6 | species | the species ID | character |
| 7-17 | [xx] to [xx] | stem density in DBH bins | trees ha ⁻¹ |
| 18-28 | [xx] to [xx] biom | biomass in DBH bins | tC ha ⁻¹ |
| 29 | max_diam | maximum DBH | cm |
| 30 | mean_diam | average DBH | cm |
| 31 | max_hgt | maximum height | m |
| 32 | leaf_area_ind | leaf area index | m ² m ⁻² |
| 33 | basal_area | basal area | m ² ha ⁻¹ |
| 34 | total_biomC | biomass | tC ha ⁻¹ |

Table 22: *Plot_Genus_Data.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|--------------------------|--------------------------|---------------------------------|
| 1 | sitelD | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | plot | plot number | integer |
| 5 | genus | genus name | character |
| 6-16 | [xx] to [xx] | stem density in DBH bins | trees ha ⁻¹ |
| 17-27 | [xx] to [xx] biom | biomass in DBH bins | tC ha ⁻¹ |
| 28 | max_diam | maximum DBH | cm |
| 29 | mean_diam | average DBH | cm |
| 30 | max_hgt | maximum height | m |
| 31 | leaf_area_ind | leaf area index | m ² m ⁻² |
| 32 | basal_area | basal area | m ² ha ⁻¹ |
| 33 | total_biomC | biomass | tC ha ⁻¹ |

If outputting plot-level data, UVAFME will also output plot-level species- and genus-level files on the characteristics of trees that died each year, the *Plot_Dead_Species.csv* file and the *Plot_Dead_Genus.csv* files. For both files, at the specified year print interval (Section 1), the individual plot conditions for trees that died from each species or genus are printed. If a species is specified as absent at a site in the input Rangelist file, the row is still printed but -999's are printed in the data columns.

Table 23: *Plot_Dead_Species.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|-----------------------|--|---------------------|
| 1 | sitelD | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | plot | plot number | integer |
| 5 | genus | genus of species | character |
| 6 | species | unique species ID | character |
| 7 | degday_death | biomass mortality due to temperature stress | tC ha ⁻¹ |
| 8 | drought_death | biomass mortality due to drought stress | tC ha ⁻¹ |
| 9 | shade_death | biomass mortality due to shade stress | tC ha ⁻¹ |
| 10 | perm_death | biomass mortality due to permafrost | tC ha ⁻¹ |
| 11 | flood_death | biomass mortality due to flooding inundation | tC ha ⁻¹ |
| 12 | nutrient_death | biomass mortality due to nutrient stress | tC ha ⁻¹ |
| 13 | fire_death | biomass mortality due to fire | tC ha ⁻¹ |
| 14 | wind_death | biomass mortality due to windthrow | tC ha ⁻¹ |
| 15 | mean_diam | average DBH | cm |
| 16 | total_biomC | biomass | tC ha ⁻¹ |

Table 24: *Plot_Dead_Genus.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|-----------------------|--|---------------------|
| 1 | sitelD | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | plot | plot number | integer |
| 5 | genus | genus name | character |
| 6 | degday_death | biomass mortality due to temperature stress | tC ha ⁻¹ |
| 7 | drought_death | biomass mortality due to drought stress | tC ha ⁻¹ |
| 8 | shade_death | biomass mortality due to shade stress | tC ha ⁻¹ |
| 9 | perm_death | biomass mortality due to permafrost | tC ha ⁻¹ |
| 10 | perm_death | biomass mortality due to flooding inundation | tC ha ⁻¹ |
| 11 | nutrient_death | biomass mortality due to nutrient stress | tC ha ⁻¹ |
| 12 | fire_death | biomass mortality due to fire | tC ha ⁻¹ |
| 13 | wind_death | biomass mortality due to windthrow | tC ha ⁻¹ |
| 14 | mean_diam | average DBH | cm |
| 15 | total_biomC | biomass | tC ha ⁻¹ |

3.2.2 Tree-level Output

UVAFME can also optionally (see Section 1) output files which print tree-level characteristics for each plot, the *Plot_Tree_Data.csv* file. For this file, at the specified year print interval (Section 1), tree characteristics for each plot are printed. Note: this will result in an even larger amount of output data and will slow down your runs considerably, thus the `tree_level_data` flag in the runtime file should be used extremely sparingly and only if necessary.

Table 25: *Plot_Tree_Data.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|----------------------|--|----------------|
| 1 | siteID | unique site ID | integer |
| 2 | runID | unique run ID | integer |
| 3 | year | simulation year | integer |
| 4 | plot | plot number | integer |
| 6 | genus | the genus of the tree | character |
| 7 | species | the species ID | character |
| 8 | treeID | the tree ID | character |
| 9 | row | the row location of the tree | integer |
| 10 | col | the column location of the tree | integer |
| 11 | age | age of tree | years |
| 12 | diam | diameter at breast height | cm |
| 13 | dcbb | diameter at clear branch bole height | cm |
| 14 | height | height | m |
| 15 | cbb_height | clear branch bole height | m |
| 16 | leaf_biomass | leaf biomass | tC |
| 17 | leaf_area | leaf area | m ² |
| 18 | woody_biomC | aboveground woody biomass | tC |
| 19 | degd_resp | growth response to temperature | 0-1 |
| 20 | drought_resp | growth response to soil moisture | 0-1 |
| 21 | shade_resp | growth response to shading | 0-1 |
| 22 | perm_resp | growth response to permafrost | 0-1 |
| 23 | flood_resp | growth response to flooding inundation | 0-1 |
| 24 | nutrient_resp | growth response to nutrients | 0-1 |

3.2.3 Fuel conditions output

UVAFME can also optionally (see Section 1) output a file which prints daily, plot-level fuel condition information, the *Fuel_Conds.csv* file. Note: this will result in an incredibly large amount of output data and will slow down your runs considerably, thus the `conds_testing` flag in the runtime file should be used extremely sparingly and only if necessary.

Table 26: *Fuel_Conds.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|--------------|--|--------------------------------|
| 1 | sitelD | unique site ID | integer |
| 2 | plot | plot number | integer |
| 3 | year | simulation year | integer |
| 4 | day | day of year | integer |
| 5 | fuel_sum | total fuel loading | kg m ⁻² |
| 6 | fuel_dec | fuel loading of deciduous leaf litter | kg m ⁻² |
| 7 | fuel_con | fuel loading of needleleaf leaf litter | kg m ⁻² |
| 8 | fuel_twig | fuel loading of twig litter | kg m ⁻² |
| 9 | fuel_smb | fuel loading of small branch litter | kg m ⁻² |
| 10 | fuel_lgbr | fuel loading of large branch litter | kg m ⁻² |
| 11 | fuel_bole | fuel loading of bole litter | kg m ⁻² |
| 12 | fuel_moss | fuel loading of live moss | kg m ⁻² |
| 13 | fuel_dmoss | fuel loading of moss litter | kg m ⁻² |
| 14 | fuel_root | fuel loading of root litter | kg m ⁻² |
| 15 | fuel_shrub | fuel loading of live shrubs | kg m ⁻² |
| 16 | BD_dec | bulk density of deciduous leaf litter | kg m ⁻³ |
| 17 | BD_con | bulk density of needleleaf leaf litter | kg m ⁻³ |
| 18 | BD_twig | bulk density of twig litter | kg m ⁻³ |
| 19 | BD_smb | bulk density of small branch litter | kg m ⁻³ |
| 20 | BD_lgbr | bulk density of large branch litter | kg m ⁻³ |
| 21 | BD_bole | bulk density of bole litter | kg m ⁻³ |
| 22 | BD_moss | bulk density of live moss | kg m ⁻³ |
| 23 | BD_dmoss | bulk density of moss litter | kg m ⁻³ |
| 24 | BD_root | bulk density of root litter | kg m ⁻³ |
| 25 | BD_shrub | bulk density of live shrubs | kg m ⁻³ |
| 26 | SAV_dec | surface area to volume ratio of deciduous leaf litter | cm ⁻¹ |
| 27 | SAV_con | surface area to volume ratio of needleleaf leaf litter | cm ⁻¹ |
| 28 | SAV_twig | surface area to volume ratio of twig litter | cm ⁻¹ |
| 29 | SAV_smb | surface area to volume ratio of small branch litter | cm ⁻¹ |
| 30 | SAV_lgbr | surface area to volume ratio of large branch litter | cm ⁻¹ |
| 31 | SAV_bole | surface area to volume ratio of bole litter | cm ⁻¹ |
| 32 | SAV_moss | surface area to volume ratio of live moss | cm ⁻¹ |
| 33 | SAV_dmoss | surface area to volume ratio of moss litter | cm ⁻¹ |
| 34 | SAV_root | surface area to volume ratio of root litter | cm ⁻¹ |
| 35 | SAV_shrub | surface area to volume ratio of live shrubs | cm ⁻¹ |
| 36 | moist_dec | moisture of deciduous leaf litter | m ³ m ⁻³ |
| 37 | moist_con | moisture of needleleaf leaf litter | m ³ m ⁻³ |
| 38 | moist_twig | moisture of twig litter | m ³ m ⁻³ |
| 39 | moist_smb | moisture of small branch litter | m ³ m ⁻³ |
| 40 | moist_lgbr | moisture of large branch litter | m ³ m ⁻³ |
| 41 | moist_bole | moisture of bole litter | m ³ m ⁻³ |
| 42 | moist_moss | moisture of live moss | m ³ m ⁻³ |
| 43 | moist_dmoss | moisture of moss litter | m ³ m ⁻³ |
| 44 | moist_root | moisture of root litter | m ³ m ⁻³ |
| 45 | moist_shrub | moisture of live shrubs | m ³ m ⁻³ |
| 46 | mef_dec | effective moisture of deciduous leaf litter | 0-1 |
| 47 | mef_con | effective moisture of needleleaf leaf litter | 0-1 |
| 48 | mef_twig | effective moisture of twig litter | 0-1 |
| 49 | mef_smb | effective moisture of small branch litter | 0-1 |
| 50 | mef_lgbr | effective moisture of large branch litter | 0-1 |
| 51 | mef_bole | effective moisture of bole litter | 0-1 |
| 52 | mef_moss | effective moisture of live moss | 0-1 |
| 53 | mef_dmoss | effective moisture of moss litter | 0-1 |
| 54 | mef_root | effective moisture of root litter | 0-1 |
| 55 | mef_shrub | effective moisture of live shrubs | 0-1 |
| 56 | sumlit_moist | moisture of total fuel | m ³ m ⁻³ |
| 57 | sumlit_SAV | surface area to volume ratio of total fuel | cm ⁻¹ |
| 58 | sumlit_BD | bulk density of total fuel | kg m ⁻³ |
| 59 | MEF | effective moisture of total fuel | 0-1 |

3.2.4 Fire conditions output

UVAFME can also optionally (see Section 1) output a file which prints plot-level fire condition information, the *Fire_Conds.csv* file. Every time a fire is ignited, this information is printed out.

Table 27: *Fire_Conds.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|---------------|---------------------------------------|-----------------------------------|
| 1 | siteID | unique site ID | integer |
| 2 | plot | plot number | integer |
| 3 | year | simulation year | integer |
| 4 | day | day of year | integer |
| 5 | FDI | fire danger index | 0-1 |
| 6 | ffmc | fine fuel moisture code | - |
| 7 | MEF | effective moisture of fuel | 0-1 |
| 8 | fuel_moisture | moisture of fuel | $\text{m}^3 \text{m}^{-3}$ |
| 9 | fuel_BD | bulk density of fuel | kg m^{-3} |
| 10 | fuel_SAV | surface area to volume ratio of fuel | cm^{-1} |
| 11 | fuel_dec | fuel loading of deciduous leaf litter | kg m^{-2} |
| 12 | fuel_con | fuel loading of needleleaf litter | kg m^{-2} |
| 13 | fuel_twig | fuel loading of twig litter | kg m^{-2} |
| 14 | fuel_smb | fuel loading of small branch litter | kg m^{-2} |
| 15 | fuel_lgbr | fuel loading of large branch litter | kg m^{-2} |
| 16 | fuel_bole | fuel loading of bole litter | kg m^{-2} |
| 17 | fuel_moss | fuel loading of live moss | kg m^{-2} |
| 18 | fuel_dmoss | fuel loading of moss litter | kg m^{-2} |
| 19 | fuel_root | fuel loading of root litter | kg m^{-2} |
| 20 | fuel_shrub | fuel loading of live shrubs | kg m^{-2} |
| 21 | Uf | effective wind speed | m min^{-1} |
| 22 | I_r | reaction intensity | $\text{kJ kg}^{-1} \text{m}^{-2}$ |
| 23 | flux_rat | propagating flux ratio | - |
| 24 | phi_wind | wind coefficient | - |
| 25 | Qig | heat of pre-ignition | kJ kg^{-1} |
| 26 | rosf | rate of spread | m min^{-1} |
| 27 | a_f | fire area | ha |
| 28 | burn_dec | deciduous leaf litter consumed | kg m^{-2} |
| 29 | burn_con | needleleaf litter consumed | kg m^{-2} |
| 30 | burn_twig | twig litter consumed | kg m^{-2} |
| 31 | burn_smb | small branch litter consumed | kg m^{-2} |
| 32 | burn_lgbr | large branch litter consumed | kg m^{-2} |
| 33 | burn_bole | bole litter consumed | kg m^{-2} |
| 34 | burn_moss | live moss consumed | kg m^{-2} |
| 35 | burn_dmoss | moss litter consumed | kg m^{-2} |
| 36 | burn_root | root litter consumed | kg m^{-2} |
| 37 | burn_shrub | live shrubs consumed | kg m^{-2} |
| 38 | I_surf | surface fire intensity | kW m^{-1} |
| 39 | tau_l | residence time of fire | min |

3.2.5 Fuel consumption output

UVAFME can also optionally (see Section 1) output a file which prints plot-level fuel consumption information, the *Cons_Data.csv* file. Every time a fire burns fuel, this information is printed out.

Table 28: *Cons_Data.csv* file output variables.

| Column Number | Column Name | Description | Units |
|---------------|--------------------|--------------------------------------|----------------------------|
| 1 | sitelD | unique site ID | integer |
| 2 | plot | plot number | integer |
| 3 | year | simulation year | integer |
| 5 | dmc | duff moisture code | - |
| 6 | duff_moist | duff moisture | $\text{m}^3 \text{m}^{-3}$ |
| 7 | rfs | relative duff moisture content | 0-1 |
| 8 | N_cons | proportion of N consumed by fire | 0-1 |
| 9 | consRoot | proportion of roots consumed by fire | 0-1 |
| 10 | emis | duff emissivity | |
| 11 | t_r | residence time of fire | min |
| 12 | duff_cons | duff consumption through smoldering | kg m^{-2} |
| 13 | hum_avail | humus content pre-fire | kg m^{-2} |
| 14 | pre_depth | depth of organic layer pre-fire | m |
| 15 | O_depth | depth of organic layer | m |
| 16 | hum_combust | proportion humus consumed by fire | 0-1 |
| 17 | bg_combust | belowground combustion | kg m^{-2} |
| 18 | agw_combust | aboveground woody combustion | kg m^{-2} |
| 19 | not_burn | live fuel that didn't burn | tC |
| 20 | canopy_bd | canopy bulk density | kg m^{-3} |
| 21 | canopy_bh | canopy base height | m |
| 22 | canopy_biom | canopy biomass | kg m^{-2} |
| 23 | R_a | critical active rate of spread | m min^{-1} |
| 24 | rosf_active | active rate of spread | m min^{-1} |
| 25 | CFB | crown fraction burnt | 0-1 |
| 26 | R_final | final rate of spread | m min^{-1} |
| 27 | I_final | final fire intensity | kW m^{-1} |
| 28 | abcombust | aboveground combustion | tC |
| 29 | bgr_combust | root combustion | tC |

4 Modifying UVAFME Code

UVAFME source code files (.f90/.F90 files) can be modified using any text editing software. [Geany](#), [Gedit](#), and [TextWrangler](#) are all good options that have Fortran-specific syntax highlighting. Once you have finished making changes you

must recompile and remake the executable file. Recompiling requires a Fortran compiler (e.g., [ifort](#) or [gfortran](#)) .

Use the command “make” within the source directory to make the new executable. Sometimes (especially if you have only made small changes) **ifort** doesn’t work very well and may not see all of the changes you have made. If you are having strange issues, try clearing all compiled files with the command “make clean” before recompiling the whole model anew.

Tip: the UVAFME *Makefile* (in the source code folder) can be changed as well. It may be especially useful to rename the executable (first line “`PROG = UVAFME_v1_NABoreal`”) for different versions so that you can keep track of all the different UVAFME versions (i.e. “`PROG = UVAFME_fire`”, etc.). Then when you run this new executable you would simply replace the command `UVAFME_v1` with your new executable name (i.e. “`./UVAFME_fire`”).

5 Tips and Tricks

Below are some common errors that may occur when running UVAFME and modifying input files and source code.

5.0.1 Column Names and Order

Except for the Rangelist file, UVAFME **does not** read the column headers for the input csv files. This means that if your order is not exactly correct (see above sections) UVAFME will read in variables incorrectly, but show no errors (though an error should occur if UVAFME reads in a variable type it is not expecting, i.e. a character when it is expecting a real). Make sure the column order in your input files exactly matches the above tables. This also means that you can change the column names for all but the Rangelist file as you see fit.

5.0.2 NAs in Sitelist File

Though most of the columns (i.e. all but the **siteID** column) may be left blank in the *UVAFME2018_sitelist.csv* file, make sure they are not written as NA/NaN’s, etc. They must be blank or UVAFME will not be able to read the file and this error will be thrown:

5.0.3 Rangelist File

As stated in Section 1, the *UVAFME2018_rangelist.csv* file is the only csv file where the column **names** are specifically read in by UVAFME and used to compare to the species IDs set up in the Specieslist file. This means that these

```

parallels@testing> ./UVAFME_v1_NABoreal file_list.txt
forrtl: severe (64): input conversion error, unit -5, file Internal Formatted Read
Image          PC          Routine          Line          Source
UVAFME_v1_NABorea 00000000005955DB Unknown          Unknown          Unknown
UVAFME_v1_NABorea 00000000005BBE9B Unknown          Unknown          Unknown
UVAFME_v1_NABorea 00000000005BA845 Unknown          Unknown          Unknown
UVAFME_v1_NABorea 0000000000410999 input_mp_read_sit 336 Input.f90
UVAFME_v1_NABorea 0000000000585EE0 MAIN__          71 UVAFME.f90
UVAFME_v1_NABorea 0000000000403002 Unknown          Unknown          Unknown
libc-2.27.so      00007F818D237B97 __libc_start_main Unknown          Unknown
UVAFME_v1_NABorea 0000000000402EEA Unknown          Unknown          Unknown
parallels@testing>

```

column names **cannot** be in quotes or an error will occur. If using a software such as **R** to create the Rangelist file, be sure to write the file without quotes in the column names. If quotes are present, the model will determine that no species are present at the sites and will skip all sites, displaying the warning message:

```

No species present in site <siteID>
Skipping site <site name>

```

5.0.4 End of Line Issues

If you have I/O errors and aren't sure what is going on (especially if you have a Mac) you may have an end of line issue. The Mac version of MS Excel does not communicate well with Fortran. If you modify any .csv files on a Mac MS Excel, be sure to save them as "Windows Comma Separated," which should solve end of line issues.

5.0.5 Adding Object Attributes

Currently, sometimes errors arise when a new attribute is added to an object (i.e. a new attribute is added to the **Plot** object; see *Plot.f90*). It seems that **ifort** doesn't always catch these additions and then memory-related issues arise. A simple solution when these errors occur is to "make clean" the entire source code folder and recompile all files.

5.0.6 Everything Else...

Otherwise, if you cannot determine what is wrong, you can add the "-traceback" flag to the DBG line in the UVAFME *Makefile*. This will give you the exact line number and module where the error occurred, and is sometimes very helpful in finding errors. Be sure to take this flag out when you are finished debugging as it adds a lot of time to runs.
